

Introduction

The Eco-Smart is an electronically operated evaporator controller engineered to save energy in refrigeration systems through precise control of superheat, space temperature, fan cycling, reducing compressor runtime, and implementing demand defrosts. The Eco-Smart was designed to be used in single and multiple evaporator installations, with a payback period of two years*, and a life expectancy that matches that of the system. Once the controller pays for itself, it continues to pay dividends for the life of the system.

*based on utility rate of \$.09/kWh

Location

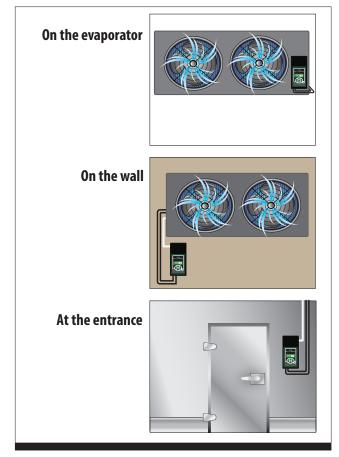

The Eco-Smart was developed with ease of installation in mind. The controller is supplied in an enclosure, with encapsulated electronics to protect the circuitry from moisture damage. This extra level of protection allows the controller to be installed in the refrigerated space.

When installing the controller, it may either be mounted on an interior/exterior wall or on the evaporator. Many evaporators have sufficient space to install the controller on the face of evaporator or on its housing. Locating the controller as close to the evaporator as possible reduces the amount of wiring when converting existing systems, as well as when it is applied on new applications.

Alternatively, users may find it beneficial to install the controller in a location providing easy access — on the wall or near the entrance. This enables the user to easily view the display, and eliminates the need to use a ladder or lift to modify the setpoints or check alarms.

If viewing the temperature outside the walk-in or refrigerated room is desirable, the Eco-Smart may be used as a digital thermostat. The controller is then installed near the door of the

Figure 1 - Eco-Smart Installation Locations

space for easy viewing of the room temperature and/or system status. See **Figure 1** for locations.

If installing the controller on the face of the evaporator, preexisting knockouts on the evaporator should be used for installing the high voltage wiring. If knockouts do not preexist, hole(s) may be carefully cut into an unobstructed area of the evaporator case. If modifying the face of the evaporator is not feasible or desired, the controller's conduit knockouts may be used with $\frac{1}{2}$ inch conduit.

The bottom side of the controller includes a cutout with cable tie slots providing a strain relief for the low voltage and sensor wires. Additional knockouts are available on either side if conduit is preferred.

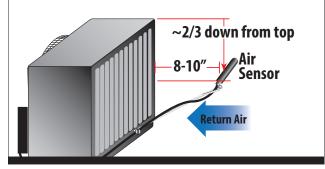

Installation & Wiring

The Eco-Smart is supplied with pluggable connectors for all connections. Pluggable connectors permit the controller to be placed in a safe location while the wiring is installed. They also simplify the wiring, allowing the wires to be fastened to the screw terminals in the open air. Once all wiring is completed using accepted wiring practices, it is plugged into the controller prior to final mounting.

Although there is one pressure transducer and four temperature sensor inputs, when used with mechanical valves (TEVs), Eco-Smart only requires the (3) sensors supplied with the kit. One sensor reads the return air temperature and the other two measure the coil temperature. NOTE! Sensor location is critical to the proper operation of the controller.

Return Air Temperature Sensor - The air temperature sensor is installed in the return air of the evaporator using the included sensor mount. Most applications allow the sensor mount to be installed using an existing screw. On evaporators where using an existing screw is not possible, the included self-tapping screw may be used to secure the sensor mount to the evaporator. **Note: Be careful to avoid damage to an evaporator tube or causing a leak in the drip pan.** When installing, it is important to prevent the air sensor from coming into contact with the mounting bracket, cable ties, or any other solid material. **Figure 2** shows an example of how to mount the sensor. The sensor must be a minimum of 8 inches from the coil surface.

Figure 2 - Return Air Sensor Placement

After the sensor is installed, route the wire back to the controller. When routing sensor wire, it is important to avoid interference from high voltage lines. If sensor wire is run parallel to the high voltage, there is a potential for inductance to affect the sensor reading. This is of particular concern with long wire runs. When extending sensors, use the 18 gage, shielded twisted pair. Sensor wires can be run beyond 100 feet when using 18 gage twisted shielded pair. After the wire has been successfully routed, it may be connected to the pluggable terminal on the controller.

Coil Temperature Sensor - As a critical input to the controller, it is essential the sensor is located at the **coldest point on the evaporator coil** for optimal operation. The coil sensor is an integral part of the control algorithm used to determine coil efficiency, to initialize defrosts, and to terminate defrosts.

Determine the coil sensor location

To determine the most appropriate sensor location, when arriving on site, put the system into defrost. The location where frost is last to disappear is where the coil sensor should be placed. Monitor both the air entering side, as well as the air exiting side, of the evaporator coil. Don't be surprised if the last place for frost to disappear is on the air exiting side. It is usually near the right or left end of the coil.

Steps to Ensure Proper Coil Sensor Location

For more robust installations, RDT recommends using two coil sensors, located as described above. Typically the coldest spot is on the side of the suction header/expansion valve side of the evaporator. Select two places that are the last to defrost, preferably at each end of the evaporator.

More often than not on coils, the location of the sensor is a short distance from the end, approximately 1 to 1-1/2" away from the right and left edges of the active coil surface. The ice tends to grow from these edges towards the center. Therefore, the sensor location is best situated approximately 1 to 1-1/2" from the outer edges and typically near the bottom 1/3rd of the evaporator. The sensor needs to be as far away from the defrost heat sources as possible. See **Figure 3.** Locating the sensor too close to the elements will cause false defrost termination temperatures. It is important to note, the most active portion of the sensor is the first 1/2" of the 1-1/2" long stainless steel probe.

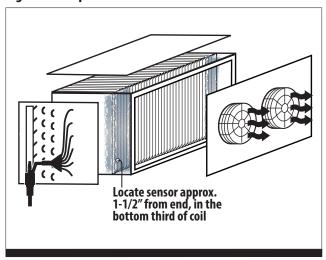

Option 1 - Sensor touching two circuit tubes

Figure 4A shows the sensor touching two circuit tubes. When inserting the sensor into the coil, the tip should touch one of the circuit tubes. It should not be located adjacent to the electric heating elements. It should be about half the distance between the heaters if possible. In **Figure 4B** the probe is inserted into the fins approximately 1/16" deeper than the stainless shielding. Pinch the fins gently together, securing the sensor in place. This provides thermal ballast to ensure a complete defrost.

Option 2 - Sensor inserted parallel to the evaporator fins

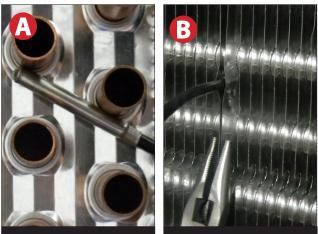

As the defrost termination sensor, it is important to ensure the sensor does not terminate defrost before all frost has been removed from the coil. In some installations, inserting the sensor into the coil may position it too close to the defrost heat source. An alternate method of positioning places the sensor vertically between the coil fins. **Figure 5** shows the proper way to secure the coil sensor.

Figure 3 - Proper Sensor Location

Circuit Tubes

Important: Verify all heating elements are working properly.

Due to the many factors influencing the evaporator performance, it is impossible for RDT to provide the proper location of every installation. However, the coil sensor is an integral part of the control algorithm used to determine coil efficiency to initiate, as well as, terminate defrosts. The coldest point in the coil can be identified from existing system knowledge or by monitoring the normal operation.

Controller Power - The high voltage wiring is protected by a metal shield fastened to the back side of the controller. The shield should be removed to gain access to the wiring connections, making note of the location of the fasteners. The screws in the upper corners are coarse thread screws, while the screw in the middle is a 4-40 machine screw.

The controller accepts either 120V or 208/240V incoming power. The controller includes metal oxide varistors (MOVs), providing protection from voltage spikes. MOVs use the same technology commonly applied to protect consumer electronics (surge protectors). They function by filtering out voltages high enough to damage the board. When the voltage exceeds the allowed amount, the MOVs short to ground, protecting the circuitry. For additional protection, the board has a replaceable 1/2 or 500mA fuse in line. The grey plug is accessible without removing the metal shield in the fuse holder. Depress slightly and turn 1/4 turn counterclockwise to remove. Replace by depressing slightly and turning 1/4 turn clockwise. Do not overtighten.

The board uses a pluggable screw terminal connector for incoming power. The terminal is in the top right corner of the controller, when the terminals are facing the user. See **Figure 6**.

Fan and Defrost Relays - There are 2 larger relays on the controller with spade connectors. These are used for the evaporator fans and defrost heaters. Due to the spacing of the enclosure the spades require a 90 degree terminal. RDT has included (4) spade connectors to assist in wiring the relays.

Evaporator Fan Relay - The fan relay is rated 10A inductive at 240V. One leg of the incoming power (L1) for the fans connects to the COM terminal of the fan relay, the upper of the two larger relays. The remaining leg, (L2) connects to one lead of the fan. The remaining fan lead should be connected to the NO (Normally Open) terminal on the fan relay. See **Figure 8**.

Defrost Heater Relay - The heater relay is rated 20A resistive at 240V. One leg of the incoming power (L1) for the heaters connects to the COM terminal of the heater relay, the lower of the two larger relays. The remaining leg, (L2) connects to one lead of the heater. The remaining heater lead connects to the NO (Normally Open) terminal on the heater relay.

Compressor/Liquid Line Solenoid Relay - The compressor relay is rated at 3A inductive at 240V. This relay uses the 3-position pluggable screw terminal to make the connection to the board. The relay is not intended to control the compressor directly. It is designed to be used to control the liquid line solenoid or as a pilot to the compressor contactor. One leg of the incoming power supply (L1) should be connected to COM terminal of the compressor relay, the upper of the two smaller relays. The remaining leg, (L2), should be connected to one lead on the solenoid/compressor contactor. The remaining lead, should be connected to the normally open (NO) position on the terminal.

Auxiliary Relay - The auxiliary relay is rated at 3A inductive at 240V. This relay uses the 3-position pluggable screw terminal to make the connection to the board. The relay may be connected to a variety of devices. One leg of the incoming power supply (L1) should be connected to COM terminal of the auxiliary relay, the lower of the two smaller relays. The remaining leg, (L2), should be attached to one lead on the connected device. The remaining alarm lead, should be connected to the normally open (NO) position on the terminal.

After all high voltage wiring is completed, the metal shield must be replaced and screws tightened.

Additional Inputs

T1 Suction Temperature Sensor (Auxiliary) - The suction temperature sensor is required when applying the controller with an electronic expansion valve. The sensor's proximity to the evaporator outlet differs slightly for electronically controlled valves from the placement of a TEV bulb. Due to the more refined control from an electronically controlled valve, the sensor must be placed as close to the outlet of the coil as feasible. Although the distance from the outlet is different, the nature of the refrigerant's flow through the tube remains unchanged, thus the orientation of the sensor remains at the 4 or 8 o'clock position. The sensor should be secured to the suction line using the included wire ties designed for low ambient operation. In addition to being configured as a suction sensor, the T1 input may also be configured like the auxiliary sensor.

Pressure Transducer - In addition to the suction temperature sensor, a pressure transducer is required for superheat measurement when applying RDT's Hybrid Stepper Valve (HSV) or Refrigeration Stepper Valve (RSV). Mount the pressure tap on the top of a horizontal section of tube, near the suction sensor, approx. 3 inches downstream of the temperature sensor.

T4 Auxiliary Temperature Sensor -The auxiliary temperature sensor provides flexibility and may be used for any purpose desired by the user. The placement of the sensor is dependent on the requirements of the user's intended application. The Auxiliary Temperature sensor must be supplied by RDT.

Digital Inputs - The controller includes (3) digital inputs. See **Table 3** for configuration options.

Mounting the Controller

Once the wiring has been run to the controller location, the controller can be connected. When installing the Eco-Smart, the (4) screws supplied in the kit may be preinstalled in the mounting surface. The controller has keyholes in each mounting tab allowing the controller to install over the screws.

Eco-Smart

Installation Instructions

User Interface

The Eco-Smart's onboard user interface uses a familiar 6-button arrangement to simplify navigation through the controller's menus. The menu has been grouped by category to provide an easy to program structure. By grouping the menu by each functional area, the user is not required to scroll though unrelated parameters to access the desired functionality.

The **left** and **right arrows** move between the menus. When pressed while in a menu, the left and right arrows will move to the main screen or the adjacent menu.

The **up** and **down arrows** move the user through the available options for each group. All users are allowed access to the variable alarms. All other information is password protected to prevent unauthorized access to the controller's functionality.

The **ENTER** button is used to save an input option when it hasbeen changed. **The enter button must be held for 3 seconds to prevent accidental changes.** Changes may be discarded by waiting, to allow the controller to timeout and return to default screen, or hitting the **BACK** button.

The BACK button is used to return to the previous screen. Pressing the BACK button three times at any time will return the user to the default view. **See Table 2 (following page).**

Controller Setup

Upon initially applying power to the controller, the controller will initialize, then automatically enter the **Introduction Mode**. The Introduction Mode consists of as little as 4 setpoints that must be configured for Eco-Smart to begin controlling the system. See **Table 2**.

The first setpoint the user is asked to enter is the desired **ROOM TEMP**. This is followed by the **DEFROST TYPE**. The controller is designed to work with electric, hot gas, and off time defrosts. The last setpoint is the **VALVE TYPE**. The controller is defaulted to be used with a mechanical valve, but may be used with a variety of EEVs, including a customer defined valve. To easily view your controller online enable **SMART ACCESS.**These are the only setpoints required to begin controlling the system, when applied on a single evaporator, with a mechanical valve.

If using a standard/predefined EEV, the user will also be prompted to specify the **REFRIGERANT**. The Eco-Smart may also be applied to user defined EEVs. When this option is selected, the user will be prompted to select **MOTOR TYPE**, **MOTOR STEP RATE**, and **MAX VALVE STEPS**. Once these have been set, the Eco-Smart will begin controlling EEV and the system.

Adjusting Controller Parameters

The controller is able to access an abundance of information from the 4-digit alphanumeric display. However, the controller requires a password, adding a degree of protection from unwanted modifications. The controller will prompt the user for a password **PASSWORD** when the user attempts to access setpoints they do not have permission to change. **Table 1** shows the menu structure of the controller. The default display of the controller always displays the actual room temperature. Pressing the **ENTER** button will display room temp **ROOM TEMP**. Pressing the **up** and **down** arrows moves the display through the **VARIABLES** menu. See Controller Navigation on page 16. By default, the controller only allows access to the room temperature. The **VARIABLES** menu consists of the current sensor readings and the relays' state. The **User Password** (1111) only provides access to the ROOM TEMP setpoint.

For the protection of the system, access to the **SETPOINT** and **MANUAL** control requires an **Installer Password (2222)**. Pressing the right or left arrow will move from the Variables menu to the next menu, shown in the Controller Navigation on page 16 a complete list of parameters is shown in **Table 3**.

Pressing the **BACK** key at any time will return the user to next level up the menu. A second press will either return to the **Main Menu** or to the room temperature reading.

SNTP COMMUNICATION ALARM	ONLY FOR SITEVIEW MANAGER: No communication to the SNTP server defined in Settings/Siteview Options

Setpoints Menu

	Parameter Name	Description
	ROOM TEMP	Walk-in freezer or cooler room temperature to be maintained
	DEFROST TYPE	Method of defrost used on the evaporator coil: Electric, Air, Hot Gas with Liquid Line Solenoid/Compressor relay off, Hot Gas with Liquid Line Solenoid/compressor relay on
	VALVE TYPE	Type of valve used on the system: mechanical, pre-configured electric, custom EEV configuration
a F	MOTOR TYPE	If VALVE TYPE = CUSTOM: The motor type used in the valve
Custom EEV only	MOTOR STEP RATE	If VALVE TYPE = CUSTOM: The motor speed setting in number of steps per second
08	MAX VALVE STEPS	If VALVE TYPE = CUSTOM: The total number of steps required to move the valve from closed to fully open
		The superheat value that the controller will maintain, (not applicable if VALVE TYPE = MECHANICAL)
	MAX OPERATING PRES REFRIGERANT	The maximum allowable suction pressure, (not applicable if VALVE TYPE = MECHANICAL) The type of refrigerant used in the refrigeration system
	AUX TEMP 4 MODE	Configuration mode of the auxiliary temperature sensor
	AUX TEMP 1 MODE	Configuration mode of the auxiliary temperature sensor (Not available if EEV is selected)
	AUX RELAY MODE	Configuration mode of the auxiliary relay.
	FAN SPEED	Provides 0-10V DC signal to control variable speed
	MIN COMP RUN TIME	Minimum amount of time the liquid line solenoid/compressor relay must remain on after it is energized
	MIN COMP OFF TIME	Minimum amount of time the liquid line solenoid/compressor relay must remain off before it can be energized again.
	REFRIG FAN MODE	Fan operation while in refrigeration mode
	DEFROST MODE DEFROSTS / DAY	The method the controller uses to determine when to initiate a defrost. If DEFROST MODE = SCHEDULED: The number of evenly spaced defrosts per day the controller will initiate.
	1ST DEFROST DELAY	If DEFROST MODE = SCHEDULED: The mount of time from controller power up until the first defrost is initiated.
	DEFROST FAN STATE	Whether or not to run the evaporator fans during defrost
	DEFROST TERM TEMP	The temperature the coil sensor(s) must exceed in order to terminate defrost. The defrost relay is de-energized at this point.
	DEFROST PARAMETER	if DEFROST MODE = DEMAND: Coefficient to KE2 Defrost algorithm
	MAX DEFROST TIME	If DEFROST MODE = SCHEDULE or RUNTIME: The maximum amount of time the defrost relay will be energized. (Not available if DEFROST MODE = DEMAND)
	DRAINTIME	Time to be in drain mode (drip time)
		If DEFROST MODE = RUN TIME: The amount of time liquid line solenoid/compressor relay is energized before the next defrost is initiated.
	ELEC DEFROST MODE FAN DELAY TEMP	If DEFROST TYPE = ELEC: Whether to leave the defrost relay energized during the defrost cycle or to utilize advanced defrost algorithm. After defrost, the coil sensor reading must fall below this temperature set point in order for the controller to resume normal fan operation.
	MAX FAN DELAY TIME	Maximum amount of time after defrost to resume normal fan operation.
	PUMP DOWN TIME	Minimum amount of time between de-energizing the liquid line solenoid/compressor relay and energizing the defrost relay.
	MULTI AIR TEMP CTRL	Select control method to use with multiple room temperature sensors
ng ed	MULTI EVAP COOL	Select type of multi evaporator control - options are synchronous or independent
Bonded Control- lers Only	MULTI EVAP DEFROST	Select whether to have all bonded controllers initiate defrost mode at the same time or independently.
	MULTI EVAP SENSOR	Select whether or not to share room temperature, coil temperature and suction pressure sensor data with bonded controllers.
	HIGH TEMP ALARM OFFSET	The number of degrees above ROOM TEMP for a HIGH TEMP ALARM condition.
	HIGH TEMP ALARM DELAY	Minutes the room temperature must remain above ROOM TEMP + HIGH TEMP ALARM OFFSET before issuing a HIGH TEMP ALARM The number of degrees below ROOM TEMP for a LOW TEMP ALARM condition.
	LOW TEMP ALARM DELAY	Minutes the room temperature must remain below ROOM TEMP - LOW TEMP ALARM OFFSET before issuing a LOW TEMP ALARM
	DOOR ALARM DELAY	If DIG IN (1, 2 and/or 3) MODE = DOOR SWITCH: The amount of time, in minutes, before an alarm condition is initiated if door is open and room temperature is 5 degrees above ROOM TEMP + AIR TEMP DIFF
	DIG IN 1 MODE	Sets the function of the digital input
	DIG IN 1 STATE	Sets whether the switch activates when opened or closed
	DIG IN 2 MODE DIG IN 2 STATE	Sets the function of the digital input Sets whether the switch activates when opened or closed
	DIG IN 3 MODE	Sets the function of the digital input
	DIG IN 3 STATE	Sets whether the switch activates when opened or closed
	2ND ROOM TEMP	If DIG IN (1, 2 and/or 3) MODE = 2ND ROOM TEMP: This value becomes the ROOM TEMP setpoint when the digital input is active
	SUCT PRES OFFSET	An offset added or subtracted from the suction line pressure transducer reading, if needed
	SUCT TEMP OFFSET	An offset added or subtracted from the suction temperature sensor reading, if needed
	AIR TEMP OFFSET	An offset added or subtracted from the room temperature sensor reading, if needed
	COIL TEMP OFFSET	An offset added or subtracted from the coil temperature sensor reading, if needed
	AUX TEMP OFFSET TEMP UNITS	An offset added or subtracted from the auxiliary temperature sensor reading, if needed Units for temperature's display in °F or °C
	AIR TEMP DIFF	The number of degrees above ROOM TEMP before the controller will go into REFRIGERATION mode
	EXTREME TEMP DIFF	ADVANCED TOPIC: Call KE2 Therm for assistance
	PROPORTIONAL	A coefficient to the valve control algorithm that increases valve responsiveness
	INTEGRAL	A coefficient to the valve control algorithm that increases valve responsiveness
	DERIVATIVE	Should not be adjusted unless instructed by KE2 Therm technical support

Standard Communication

The Eco-Smart uses standard TCP/IP communication. The controller is equipped with an RJ-45 female connector to connect to Ethernet cable. To communicate with the controller, use a web browser to see the controller's MasterView webpage. The information is stored on the controller, so special software is not required.

A standard Ethernet cable is connected to the controller, and the other to the Ethernet port on the PC or Smart Gate. Networking the controllers is required for installations where multiple evaporators are piped to a single condenser. This prevents damage to the system by synchronizing the defrost cycles. When networked, the controllers share information, such as air temperature, allowing a controller in alarm mode to continue providing refrigeration until the system is serviced.

For more information on networking multiple controllers, visit KE2 Therm's website at:

http://ke2therm.com/productliteratureevapmisclit.html and see bulletin Q.5.10 Advanced Configuration.

Communication using Smart Access

While accessing the Eco-Smart through the Internet using port forwarding or a VPN continues to be free, RDT recognizes that some customers prefer the simplicity and convenience of Smart Access to benefit from the controller's communication capability.

With version 4.0 firmware, the Eco-Smart comes with Smart Access capability. Smart Access makes it is easier than ever to monitor and adjust your Eco-Smarts remotely. For a nominal monthly fee, Smart Access provides quick, easy, real time access to your refrigeration system 24/7. No port forwarding. No VPN.

All the Eco-Smart needs is a physical connection to the network router with a cat 5 cable. Once enabled, Smart Access automatically connects to your personal web portal, hosted by KE2 Therm, and provides a "customized" dashboard of all the controllers you setup with Smart Access.

For more information on communications using Smart Access, visit KE2 Therm's website at:

http://ke2therm.com/productliteratureevap4.html and see bulletin A.1.76 KE2 Evap v4.0 with KE2 Smart Access (overview) and Q.1.34 KE2 Smart Access Setup and Customizina.

Table 4 - Defrost Defaults

Setpoint	Electric	Air	Hot Gas
Defost Fan State:	Off	On	Off
Defrost Termination Temperature Setpoint:	50	40	50
Defrost Parameter	30	40	15
Electric Defrost Mode:	Pulse	Permanent	Permanent

Table 5 - Ethernet Specification Summary

Specifications	Ethernet - Unshielded Twisted Pair (UTP)
Topology	star
Network Friendly	YES
Maximum Cable Length	330 feet (copper)
Maximum Data Rate	1,000 mbs
Native Internet	YES
Supported Devices	thousands
Response Time	milliseconds

For additional information on Ethernet Cable, consult IEEE 802.

Table 6 - Specifications

Controller	
Input Voltage:	120V or 208 - 240V
Ambient Temp:	-40° to 140°F
Operating Temp:	-40° to 140°F
Display:	4-digit alphanumeric LED
IP Rating:	IP65
Inputs:	(4) temperature sensors (KE2 SKU 20200)
	(1) pressure transducer (KE2 SKU 20204)
Valve Types:	unipolar and bipolar stepper motors (12V)
	20A resistive (defrost)
Relays:	10A inductive (evaporator fan)
	(2) 3A inductive rated cycles
Digital Input 1:	door contact, use 2nd air temp setpoint, disabled, system off, external alarm notification
Digital Input 2:	door contact, use 2nd air temp setpoint, disabled, system off, external alarm notification, defrost lockout, defrost interlock
Digital Input 3:	door contact, use 2nd air temp setpoint, disabled, system off, external alarm notification, lights
Communication:	Standard TCP/IP
Pressure Transducer -	pn 20201 (10 ft lead) or pn 20204 (40 ft lead)
Pressure Range:	0 to 150 psia
Proof Pressure:	450 psi
Burst Pressure:	1500 psi
Operating Temp:	-40° to 275°F
Temperature Sensor	
Sensor Specs:	-60° to 150°F moisture resistant package
